

## Trailer Spotter

Trailer Spotter - Gantry cranes are used in order to move and unload big containers off of trains and ships. They are most often found functioning in ports and railroads. Their bases include massive crossbeams that run on rails so as to raise containers from a place to another. A portainer is a special type of gantry that moves materials onto and off of ships specifically.

Floating cranes are attached on pontoons or barges and are one more important piece of equipment important to the shipping industry. As they are placed in water, they are meant for a variety of services including building bridges, salvaging ships and port construction. Floating cranes could handle very heavy weights and containers and like portainers, they could likewise unload ships.

Loader cranes consist of hydraulic powered booms which are fitted onto trailers so as to load supplies onto a trailer. The jointed parts of the boom can be folded down when the equipment is not in use. This type of crane can be even considered telescopic because a section of the boom can telescope for more versatility.

Normally seen in automated warehouses, stacker cranes tend to follow an automated retrieval system and could operate using a remote. These cranes are equipped with a forklift equipment and could be seen in large automated freezers, stacking or obtaining foodstuff. Using this type of system allows personnel to remain out of that cold situation.

Tower cranes are often the tallest cranes and usually do not have a movable base. They ought to be assembled part by part. Their base resembles a long ladder along with the boom at right angles to the base. These cranes specialize in the construction of tall structures and are normally affixed to the inside of the building itself during the construction period.
